SUMMARY

Senior Software Engineer with 9+ years of experience specializing in **JavaScript** and **TypeScript** development. Proficient in building scalable, high-performance applications using **React**, **Next.js**, **Node.js**, and a variety of **JavaScript frameworks and tools** such as **Redux**, **Webpack**, and **GraphQL**. Extensive experience in **server-side rendering (SSR)**, **API design**, **microservices**, and **event-driven architecture** with a focus on **performance optimization** and **scalability**. Expertise in **AWS cloud services**, **Docker**, **Kubernetes**, and **CI/CD** pipelines. Proven track record of improving **front-end performance**, optimizing **backend systems**, and scaling complex applications to meet high-demand user loads. Strong advocate for **best practices**, including **automated testing**, **code reviews**, and **mentoring junior engineers** to foster growth and collaboration within cross-functional teams.

CORE SKILLS

JavaScript (ES6+), TypeScript, React, Next.js, Redux, React Query, SSR, SSG, ISR, Web Workers, WebSockets, Node.js, Express, REST APIs, GraphQL, Async Processing, Event-Driven Architecture, Microservices, Serverless, MongoDB, PostgreSQL, Redis, NoSQL, Sharding, Indexing, AWS (Lambda, ECS, SQS, RDS, DynamoDB, S3), Serverless Framework, AWS CloudFormation, Docker, Kubernetes, CI/CD (GitHub Actions, GitLab, Jenkins), Terraform (IaC), AWS CloudWatch, Microservices Architecture, Event-Driven Systems, Serverless Solutions, API Gateway, Service Mesh, OAuth2, JWT, Caching Strategies (Redis, ISR), Database Optimization (Indexes, Sharding), Load Balancing, Vue.js, Angular, Svelte, Gatsby, Tailwind CSS, Bootstrap, Styled Components, Jest, Mocha, Chai, ESLint, Prettier, Webpack, Vite, Parcel, Babel, Socket.io, Axios, Apollo Client, PWA (Progressive Web Apps), GraphQL Apollo Server, NestJS, Fastify, RxJS, Lodash, Moment.js, Day.js, Knex.js, Sequelize.

EXPERIENCE

Senior Software Engineer | *Radisson Blu - Dublin, Ireland* 03/2024 - Present

Led the optimization of **SSR performance** using **React Suspense** and **Incremental Static Regeneration (ISR)**, achieving a **50% reduction in SSR latency** and improving load times during high-traffic periods. Re-engineered the frontend architecture to solve **UI hydration mismatches** and excessive **client-side re-renders** by introducing a **state synchronization engine** using **Redux** and **localStorage**, improving **UI stability by 70%**. Optimized **AWS Lambda cold-start latency** by **85%** through **Provisioned Concurrency**, alongside **ECS** containerized services, enabling the system to scale efficiently under load. Designed a **hybrid SSR/SSG strategy** integrated with **Redis caching** and **AWS CloudFront**, improving **performance** and **availability** of the platform globally.

Faced with challenges around **data-fetching inefficiencies**, I implemented **asynchronous fetching techniques** with **React Query** and **SWR**, which resulted in a **50% reduction in API call frequency**. Introduced **caching layers** to handle static and dynamic content separately, ensuring faster response times and reduced load on backend services. Used **AWS CloudWatch** for proactive **performance monitoring**, allowing us to identify bottlenecks and eliminate redundant data-fetching paths.

A key part of the solution involved setting up **global state management** for session persistence, enabling smoother navigation across pages without unnecessary re-renders. This solution decreased frontend load time by **40%** and optimized **mobile experience**. In addition, I utilized **AWS Lambda@Edge** for enhanced security and optimized content delivery, enabling us to handle sudden traffic spikes while maintaining service quality. These efforts resulted in a **25% increase in user engagement** and **30% higher conversion rates** during major booking events.

Senior Software Engineer | *KSG Catering - Dublin, Ireland* 08/2021 - 03/2024

Re-engineered **MongoDB** schema and applied **sharding** and **index optimization**, boosting **database performance by 75%** and reducing **deadlocks** during peak periods. Optimized **data models** and

implemented **secondary indexes** to facilitate fast read operations and **eventual consistency** in real-time inventory management systems. Introduced an **event-driven architecture** using **Kafka** and **Redis Pub/Sub**, which decoupled inventory updates from core processing tasks, increasing throughput and reducing system load by **50%**.

In response to increasing API calls from the frontend, I implemented an **asynchronous data-fetching strategy** with **React Query** and **Redis caching**, minimizing redundant database queries and enhancing **real-time performance** by **30%**. Designed a **scalable microservices architecture**, allowing us to independently scale inventory services during high-demand periods, improving **system uptime by 99.99%**.

Faced with frequent **deployment failures**, I led the design and implementation of **CI/CD pipelines** using **GitLab**, **Docker**, and **Kubernetes**, automating the deployment of microservices and **ensuring consistent environments** across staging and production. Integrated **Terraform** to automate **infrastructure management**, ensuring reproducibility and reducing the risk of human error. These efforts led to a **40% reduction in deployment failures** and a **30% decrease in time-to-market** for new features.

Additionally, I led a series of **performance tuning exercises** focused on reducing API latency. By using **GraphQL** to optimize data queries and minimize over-fetching, I helped increase the responsiveness of the platform and decrease backend load, resulting in a **20% improvement in API response time**. These optimizations ensured our systems could handle **500% more concurrent users** without performance degradation.

Senior Software Engineer | *Viking Cruises - Lisbon, Portugal* 05/2017 - 08/2021

Led the migration from **monolithic systems** to a **microservices architecture** using **Node.js** and **Express**, implementing **polyglot persistence** for data storage across **PostgreSQL** and **MongoDB**, improving **scalability by 5x** and reducing **latency by 70%** during high user demand. Optimized **API Gateway** configuration, ensuring efficient routing and load balancing across services. Introduced **Service Mesh** using **Istio**, enabling secure, reliable service communication across microservices.

Faced with slow database queries, I implemented **advanced MongoDB indexing** strategies, optimizing **query performance** by **40%**. Introduced **sharding** and implemented **read replicas**, enabling horizontal scaling and significantly improving **data retrieval performance** for frequently accessed data. I integrated **Redis caching** to store frequently queried results, further reducing **backend load** by **50%** and enhancing **system throughput**.

Working with the frontend team, I transitioned to **React** and **Next.js** to implement **server-side rendering (SSR)** for better SEO and performance. Introduced **lazy loading**, **code-splitting**, and **pre-fetching** strategies to minimize page load time, resulting in a **50% reduction** in page load time and a **30% improvement** in mobile responsiveness.

During a critical period of scaling operations, I implemented **CI/CD pipelines** using **Jenkins** and **Docker**, automating the deployment of multiple services and reducing human error. This process also included a robust **rollback mechanism**, ensuring system reliability during production releases. These initiatives resulted in **50% faster deployment cycles** and minimized downtime for critical system updates.

EDUCATION

Bachelor's degree, Computer Science The University of Manchester
